# The heritage of innovation

Ewellix is a global innovator and manufacturer of linear motion and actuation solutions. Our state-of-the-art linear solutions are designed to increase machine performance, maximise uptime, reduce maintenance, improve safety and save energy. We engineer solutions for assembly automation, medical equipment, mobile machinery, distribution and a wide range of other industrial applications.

## Technology leadership

We earned our reputation through decades of engineering excellence. Our journey began over 50 years ago as part of the SKF Group, a leading global technology provider. Our history provided us with the expertise to continuously develop new technologies and use them to create cutting edge products that offer our customers a competitive advantage.

In 2019, we became independent and changed our name to Ewellix. We are proud of our heritage. This gives us a unique foundation on which to build an agile business with engineering excellence and innovation as our core strengths.

## Global presence and local support

With our global presence, we are uniquely positioned to deliver standard components and custom-engineered solutions, with full technical and applications support around the world. Our skilled engineers provide total life-cycle support, helping to optimise the design, operation and maintenance of equipment thus improving productivity and reliability while reducing costs. At Ewellix, we don't just provide products; we engineer integrated solutions that help customers realise their ambitions.

## Schaeffler Group – We pioneer motion

Ewellix is since 2023 owned by the Schaeffler Group.

As a leading global supplier to the automotive and industrial sectors, the Schaeffler Group has been driving forward groundbreaking inventions and developments in the fields of motion and mobility for over 75 years.

With innovative technologies, products, and services for electric mobility, CO<sub>2</sub>-efficient drives, Industry 4.0, digitalization, and renewable energies, the company is a reliable partner for making motion and mobility more efficient, intelligent, and sustainable.

Schaeffler manufactures high-precision components and systems for powertrain and chassis applications as well as rolling and plain bearing solutions for a large number of industrial applications.

# Trusted engineering expertise

Our industry is in motion; pushing towards solutions that reduce environmental impact and leverage new technology. We provide technical and manufacturing expertise to overcome our customers' challenges.

## Engineering for the future

We work in a **wide range of industries**, where our solutions provide key functionality for business critical applications.

For the **medical industry**, we provide precision components for use in core medical equipment.

Our unparalleled understanding of **assembly automation** systems is based on decades of research into advanced automation components and techniques.

Our deep knowledge of **mobile machinery** provides powerful and reliable electromechanical solutions for the harshest conditions. In an **industrial distribution** setting, we supply linear expertise to our partners, empowering them to serve customers with greater efficiency.

## We offer excellence

We have a **unique understanding of linear equipment** and how it's integrated in customers' applications to provide the best performance and machine efficiency.

**We assist our customers** by creating equipment that runs faster, longer and that is safe and sustainable.

We provide a wide variety of **linear motion components** and **electromechanical actuators** for equipping any automation application, thus helping our customers **increase productivity, reduce their footprint, energy use and maintenance.**

### Actuation systems

### Ball and roller screws

### Linear guides and systems

# Introduction

# 1.1 Product description

As the world's leading manufacturer of rolling bearings, Ewellix supplies practically every type of rolling bearing for rotary and linear movements. The standard profile rail guides produced by Ewellix are brought together in this catalogue. Ewellix profile rail guides are accuracy rolling bearings for linear movements and are therefore suitable for use in most types of machinery. With these profile rail guides it is possible for Ewellix to offer a guide system which achieves a good price/performance ratio.

Profile rail guides from Ewellix are available in many designs and sizes, and thanks to their unlimited stroke they can be adapted to any linear movement. They consist of a rail guide with ground raceways on which one or several guide carriages can be moved with an unlimited stroke. The guide carriages are made of tempered bearing steel into which the hardened raceways of the ball circuits are inserted. Fixing holes in the attachment surfaces enable machine parts to be directly mounted onto the carriages. Fundamentally, profile rail guides constitute a coupled angular ball bearing in back-to-back arrangement and, depending on the application, are available in different preload classes.

The raceways of the profile rail and of the carriage are arranged at an angle of 45°. As a result, the system has the same load capacity in the four main load directions as well as a high moment load capacity.

Depending on the load conditions and the required service life, a selection can also be made between two design versions. In addition to the standard carriage length, a series with extended carriages is available which exhibits higher load rating. To meet the requirements of operating practice, a range of different guide systems is offered. Their main features are load capacity, screw connections to provide the fastening points on the carriage and the sectional height.

Thanks to the modular design of the systems, subsequent changes are not a problem. This catalogue brings together all the data which we feel is relevant.

If you require additional information please get in touch with one of our sales companies.

## 1.2 Design

Just as with rotary bearings, the raceways of profile rail guides can be arranged in an X- or O-arrangement. The load carrying capacity of these two arrangements are essentially the same. Therefore, there are no basic differences in behavior in the vast majority of load situations, except when they are subjected to moment loads around the X-axis.

The LLR profile rail guides from Ewellix feature an O-arrangement, based on the contact angle of the rolling elements (→ **fig. 1**). The advantage of this arrangement is that especially in one-axis systems, the moment-related rigidity is higher than comparable systems with an X-arrangement.

Due to the design-related bigger lever arm, the O-arrangement provides better rigidity and thus higher accuracy.

Fig. 1

*Schematic illustration of ball-arrangement*

## 1.3 Features and benefits

- Carriages with and without ball chain
- High load capacities in all main directions and high moment load capacities
- High dynamic performances:  $v = 5 \text{ m/s}$ ;  $a_{\text{max}} = 500 \text{ m/s}^2$
- Low noise and smooth, light running due to optimised ball recirculation and ideal ball chain geometry
- Long term lubrication system
- Lube ports with metal threads on all sides.
- Full interchangeability due to standardised rail, with or without rail seal cover strip, for all carriage versions
- Various accuracy and preload classes
- Carriages can be screwed from above or below, depending on type.
- Improved stiffness under lift off and side loading conditions when additional mounting screws are used for the holes in the centre of the carriage
- Integrated all-round sealing through front and longitudinal seals
- Wide range of accessories
- Both grease and oil lubrication possible despite initial grease application
- Wide range of accessories
- Worldwide Ewellix service network
- Both sides of the guide rail can be used as reference edges

## Selection guide

# 2.1 Technical data

## 2.1.1 General information

The general technical data applies to all rail guides (all carriages and rails). Special technical data is listed separately for the individual designs.

### Preload classes

In view of the different user requirements, the ball rail guides can be supplied in four different preload classes.

So as not to reduce the service life, the preload should not amount to more than 1/3 of the bearing load F.

In general, the stiffness of the carriage increases according to the preload increase.

### Guide systems with parallel rails

- In connection with the selected preload class the permissible deviation in parallelism of the rails must also be taken into account (see tables for the various designs).
- For the installation of rail guides in the accuracy class P5 we recommend the version with clearance T0 or the preload class T1 in order to avoid stresses owing to the tolerances.

### Speed

$v_{\max}$ : 5 m/s

### Acceleration

$a_{\max}$ : 500 m/s<sup>2</sup>

Only in the case of preloaded systems. In the case of non-preloaded systems:  $a_{\max} = 50 \text{ m/s}^2$

### Temperature resistance

$t_{\max}$ : 100 °C

This is a maximum value which is only permissible for a short time. In continuous operation a maximum temperature of 80 °C must not be exceeded.

## Friction

The friction coefficient  $\mu$  of the ball rail guide is approx. 0,002 to 0,003 (not including the friction of the seal). As a result of the design with 4 ball rows a 2-point contact exists for all load directions. This reduces friction to a minimum (→ fig. 1).

Fig. 1

## Seals

Seals should prevent the penetration of dirt and chips into the interior of the carriage in order to avoid premature failure.

### Universal seal

Universal seals are installed as standard in Ewellix carriages.

They have a constant sealing effect on rails with and without cover strip. In addition to efficient sealing, the design also provides for low friction. For applications where low friction is required light-contact seals are available on request.

### Front seal

Front seals can be ordered as accessories and are attached by the customer. They are suitable for use in environments with fine dust or metal particles, as well as coolants or cutting fluids.

**NOTE:** For extreme duty in environments with coarse dirt or metal particles, or where there is massive use of coolants or cutting fluids, Viton seals are available on request. Viton seals have to be attached by the customer.

## Scraper plates

Scraper plates can be ordered as accessories (have to be attached by the customer). They are suitable for use in most environments where coarse dirt or chips are encountered.

## 2.1.2 Load rating

### Definition of the basic dynamic load rating C

The radial load, constant in magnitude and direction, which a linear rolling bearing can in theory accommodate for a basic rating life represented by a travelled distance of 105 m (to DIN 636 Part 1). The basic dynamic load ratings in the tables are generally 30 % higher than the values to DIN. They have been verified in tests.

### Definition of the basic static load rating C<sub>0</sub>

The static load in the direction of loading which corresponds to a calculated load in the centre of the most highly loaded contact point between the rolling element and both raceways (rail) at an osculation of  $\leq 0,52, 4\ 200$  MPa.

**NOTE:** At this load on the contact point a permanent total deformation of the rolling element and raceway occurs which corresponds to about 0,0001 times the rolling element diameter (to DIN 636 Part 2).

### Definition and calculation of the basic rating life

The calculated life achievable with 90 % reliability for a single rolling bearing or a group of evidently identical rolling bearings running under identical conditions given the material generally used today of normal manufacturer's quality and usual operating conditions (to DIN 636 Part 1).

#### Basic rating life at constant speed

The basic rating life L or L<sub>h</sub> can be calculated applying the formula 1, 2 or 3:

$$1) L_{10} = \left( \frac{C}{P} \right)^3 10^5$$

$$2) L_{10h} = \frac{L_{10}}{2 \times s \times n \times 60}$$

#### Basic rating life at changing speed

$$3) L_{10h} = \frac{L_{10}}{60 \times v_m}$$

$$4) v_m = \frac{t_1 \times v_1 + t_2 \times v_2 + \dots + t_n \times v_n}{100}$$

- L<sub>10</sub> = basic rating life (m)
- L<sub>10h</sub> = basic rating life (h)
- C = basic dynamic load rating (N)
- P = equivalent load (N)
- s = stroke length (m)
- n = stroke frequency (double strokes/min)

- $v_m$  = mean speed (m/min)
- $v_1, v_2, \dots, v_n$  = travel speeds (m/min)
- $t_1, t_2, \dots, t_n$  = time proportions for  $v_1, v_2, \dots, v_n$  (%)

The formulae for calculating the service life of profile rail guides apply to a stroke length of  $S \geq 2$  times the carriage length. At lower values the load rating is reduced. Please consult Ewellix.

### Dynamic equivalent bearing load for calculation of the service life

For a fluctuating bearing load the dynamic equivalent loading  $F$  is calculated according to **formula 5**:

$$5) F_m = \sqrt[3]{\frac{F_1^3 \times s_1 + F_2^3 \times s_2 + \dots + F_n^3 \times s_n}{s}}$$

- $F_m$  = constant mean load (N)
- $F_1, F_2 \dots F_n$  = constant loads during stroke lengths  $s_1, s_2, \dots, s_n$  (N)
- $s$  = total stroke length ( $s = s_1 + s_2 + \dots + s_n$ ), during which loads  $F_1, F_2 \dots F_n$  have an effect (mm)

\* given a combined bearing load

### Note on dynamic load capacities and moments

Determination of dynamic load capacities and moments is based on a travel life of 100 000 m. However, frequently this is determined on the basis of only 50 000 m. In this case for comparison: multiply values C, MC and MA by 1.26 in accordance with Ewellix tables. For carriages with ball chain the permissible moments are reduced in accordance with the load ratings.

## 2.1.3 Preload classes

For perfect operating behaviour under various operating conditions in an extremely wide range of applications it is necessary to establish the suitable preload. In general, a slight to medium preload is enough for the majority of applications. For special applications in which high shock loads and vibration can occur it is advisable to use a higher preloading. The preload classes offered by Ewellix are categorised in **table 4**.

### Selection of the preload class

In the designs with clearance no preloading is achieved. Instead, there is clearance of between 1 and 10  $\mu\text{m}$  between the carriage and rail. If two rails and more than one carriage per rail are used this clearance is in most cases equalised by parallelism tolerances.

Preload force referred to the basic dynamic load rating  $C_{dyn}$  of the respective carriage.

#### Example:

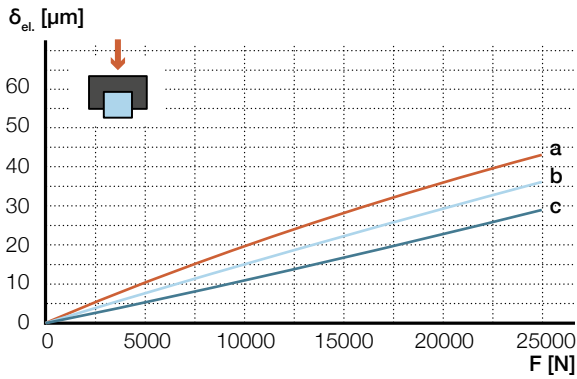

- Carriage LLRHC 35 A
- $C = 41\,900\text{ N}$
- Preload  $0,02 \times C = 838\text{ N}$
- This carriage is preloaded with a basic load of approx. 838N.

Table 4

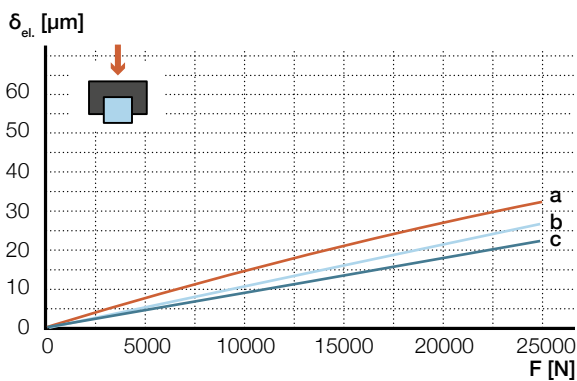

Versions and area of applications

Preload class	Preload force $F_{pr}$
<b>T0 – Clearance</b>	For particularly smooth-running guide systems with low friction and low external influences. Designs with clearance are only available in the accuracy classes P5 and P3.
<b>T1 - Preload 0,02 C</b>	For precise guide systems with low external load and high requirements in respect of overall stiffness.
<b>T2 - Preload 0,08 C</b>	For precise guide systems with high external load and high requirements in respect of overall stiffness; also recommended for single-rail systems. Above-average moment loads are absorbed without any significant elastic deformation. At only medium moment loads the overall stiffness is further improved.
<b>T3 - Preload 0,13 C</b>	For highly rigid guide systems such as precision machine tools or injection mould clamping units. Above-average loads and moments are absorbed with lowest-possible elastic deformation. Version with preload T3 only available in accuracy classes P1, P01 and P001.

## Deflection as a function of preload class and carriage

**Example:**  
 Carriage LLRHC 35 A,  
 — a = Preload 0,02 C (T1)  
 — b = Preload 0,08 C (T2)  
 — c = Preload 0,13 C (T3)

**Example:**  
 Carriage LLRHC 35 LA,  
 — a = Preload 0,02 C (T1)  
 — b = Preload 0,08 C (T2)  
 — c = Preload 0,13 C (T3)

**Example:**  
 Carriage LLRHC 35 U,  
 — a = Preload 0,02 C (T1)  
 — b = Preload 0,08 C (T2)  
 — c = Preload 0,13 C (T3)

**Example:**  
 Carriage LLRHC 35 LU,  
 — a = Preload 0,02 C (T1)  
 — b = Preload 0,08 C (T2)  
 — c = Preload 0,13 C (T3)

**Legend**

$\delta_{el}$  = elastic deformation  
 F = load

## 2.1.4 Accuracy

### Accuracy classes and their tolerances

Ewellix profile rail guides are available in five accuracy classes. As shown in the adjacent illustration, the tolerances are defined for each accuracy class. The stated accuracy classes are available for almost all types of profile rail guides. For the designs which can be supplied please refer to the respective table on **page 11**.

Dimensional tolerance in height “H”

The dimensional tolerance in height “H” is the maximum deviation of the height “H” for the carriages on a profile rail (**Table 1**).

Dimensional tolerance in width “N”

The dimensional tolerance in width “N” is the maximum deviation of the “N” dimension for the carriages on a profile rail (**Table 1**).

- The “N” dimension designates the distance of the mounting surface of the profile rail from the ground side surface of the carriage.
- The accuracies stated are mean values and relate to the centre of the carriage.

The tolerances should be checked again after the profile rail guide has been mounted on the machine bed.

### Problem-free interchangeability through precision manufacture

The rail and carriage are produced so precisely by Ewellix, especially in the ball raceway area, that each individual element can be exchanged at any time. For example, a carriage can be used without any problems on different rails of the same size. Conversely, various carriages can be used on one rail.

Table 1

Precision class <sup>1)</sup>	Tolerances		Differences in dimension H and N on one rail	
	H	N	ΔH max.	ΔN max.
–	μm		μm	
P5	±100	±40	30	30
P3	±40	±20	15	15
P1	±20	±10	7	7
P01	±10	±7	5	5
P001	±5	±5	3	3

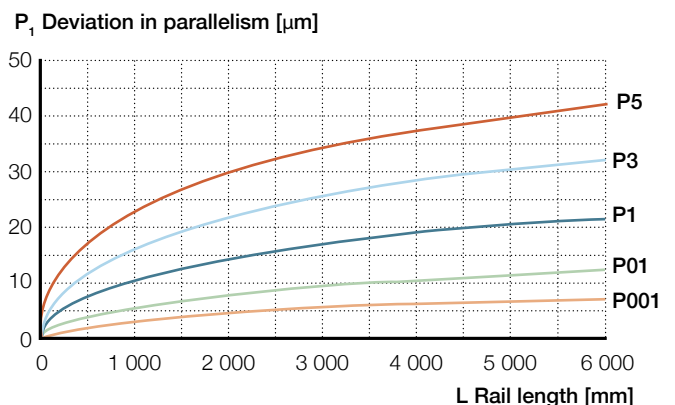

For any combination of carriages and rails over the entire rail length

For different carriages on the same rail position

<sup>1)</sup> Measured at the centre of the carriage

Diagram 1

## 2.1.5 Selection criteria for combination of accuracy classes

### Recommendations for the combination of accuracy classes

Recommended for short strokes and small distances between the carriages: Carriage in higher accuracy class than guide rail. Recommended for long strokes and larger distances between the carriages:

Guide rail in higher accuracy class than carriage.

### Running accuracy as selection criterion

By means of perfected ball entry and exit zones in the carriages of accuracy classes P1 and P001, a hitherto unattained running accuracy accompanied by extremely low pulsation is achieved.

This is particularly suitable for ultra-fine metal cutting operations, metrology, high-precision scanners, erosion techniques etc.

Carriage	Rails	P5 µm	P3 µm	P1 µm	P01 µm	P001 µm
P5	Tolerance dimension H (µm)	± 100	± 48	± 32	± 23	± 19
	Tolerance dimension N (µm)	± 40	± 28	± 22	± 20	± 19
	Max. difference of dimensions H and N on a rail (µm)	30	30	30	30	30
P3	Tolerance dimension H (µm)	± 88	± 40	± 23	± 23	± 19
	Tolerance dimension N (µm)	± 33	± 20	± 14	± 20	± 19
	Max. difference of dimensions H and N on a rail (µm)	15	15	15	15	15
P1	Tolerance dimension H (µm)	± 84	± 34	± 21	± 11	± 7
	Tolerance dimension N (µm)	± 28	± 16	± 10	± 8	± 7
	Max. difference of dimensions H and N on a rail (µm)	7	7	7	7	7
P01	Tolerance dimension H (µm)	± 83	± 33	± 19	± 10	± 6
	Tolerance dimension N (µm)	± 27	± 15	± 9	± 7	± 6
	Max. difference of dimensions H and N on a rail (µm)	5	5	5	5	5

	Max. difference of dimensions H and N on a rail (µm)	3	3	3	3	3

# 2.2 Calculation of bearing loads

Fig. 1

Fig. 2

Fig. 3

## Dynamic equivalent bearing load

For a combined external load – vertical and horizontal – the dynamic equivalent load  $F$  is calculated by means of **formula 6**. (→ **fig. 1**)

$$6) F = |F_v| + |F_H|$$

dynamic equivalent load (N)

$F_v$  = dynamic external load, vertical (N)

$F_H$  = dynamic external load, horizontal (N)

**NOTE:** The design of the ball rail guide permits this simplified calculation.

**NOTE:** If different load stages exist for  $F_v$  and  $F_H$ ,  $F_v$  and  $F_H$  must be calculated individually using **formula 5**. An external load applied at any angle to the carriage must be divided into the proportions  $F_v$  and  $F_H$ . The amounts are then used in **formula 6**.

## Dynamic equivalent bearing load

For a combined external load – vertical and horizontal – in combination with a torsional moment the dynamic equivalent load  $F$  can be calculated using **formula 7**. (→ **fig. 2**)

$$7) F = |F_v| + |F_H| + C \times \frac{|M|}{M_t}$$

$F$  = dynamic equivalent load (N)

$F_v, F_H$  = dynamic external loads (N)

$M$  = dynamic torsional moment (Nm)

$C$  = basic dynamic load rating (N)

$M_t$  = dynamic permissible moment (Nm)

**Formula 7** only applies if a single rail is used.

**NOTE:** If different load stages exist for  $F_v$  and  $F_H$ ,  $F_v$  and  $F_H$  must be calculated individually using **formula 5**. An external load applied at any angle to the carriage must be divided into the proportions  $F_v$  and  $F_H$ . The amounts are then used in **formula 7**.

## Static equivalent bearing load

For a combined external static load – vertical and horizontal – in connection with a static torsional moment the static equivalent load  $F_0$  can be calculated using **formula 8**. The static equivalent load  $F_0$  must not exceed the static load rating  $C_0$ .

**Formula 8** only applies if a single rail is used. (→ **fig. 3**)

$$8) F_0 = |F_{v0}| + |F_{H0}| + C_0 \times \frac{|M_0|}{M_{t0}}$$

$F_0$  = static equivalent load (N)

$F_{v0}, F_{H0}$  = static external loads (N)

$M_0$  = static torsional moment (Nm)

$C_0$  = basic static load rating (N)

$M_{t0}$  = static permissible

**NOTE:** An external load applied at any angle to the carriage must be divided into the proportions  $F_{v0}$  and  $F_{H0}$ . The amounts are then used in **formula 8**.

**Note on dynamic load capacities and moments**

Determination of dynamic load capacities and moments is based on a travel life of 100 000 m. However, frequently this is determined on the basis of only 50 000 m. In this case for comparison: multiply values C, M<sub>C</sub> and M<sub>A</sub> by 1.26 in accordance with Ewellix tables. For carriages with ball chain the permissible moments are reduced in accordance with the load ratings.

### 3.1.1 Carriage LLRHC ... SA

Flange short. Standard height.

For type designation see designation system

**Dynamic values**

Speed  $v_{max} = 5 \text{ m/s}$

Acceleration  $a_{max} = 500 \text{ m/s}^2$

Dimensional drawing

a) For O-ring

- Size 15: Ø 4 x 1,0 (mm)
- Size 20-35: Ø 5 x 1,0 (mm)
- Open lubrication hole as required.
- See additional elements:
- Mounting of lubrication adapter.

b) Lubrication nipple size 15 and 20: Funnel-type nipple

- Type A – Thread size M3 x 5, DIN 3405
- B2 = 1,6 mm
- When using other nipples, the max. permissible screw depth of 5 mm must be observed!
- Size 25 to 35: M6 x 8, DIN 71412
- B2 = 9,5 mm
- When using other nipples, the max. permissible screw depth of 8 mm must be observed!
- Lubrication nipple supplied along with the rail guide (unmounted).
- Connection possible at all sides.
- If pin holes are needed, please refer to section "Mounting instructions".

■ Standard range

Dimensional drawing

- a) For O-ring  
 Size 15: Ø 4 x 1,0 (mm)  
 Size 20-35: Ø 5 x 1,0 (mm)  
 Open lubrication hole as required.
- b) Lubrication nipple size 15 and 20: Funnel-type nipple  
 Type A – Thread size M3 x 5, DIN 3405  
 B2 = 1,6 mm  
 When using other nipples, the max. permissible screw depth of 5 mm must be observed!
  
- Size 25 to 35:  
 M6 x 8, DIN 71412  
 B2 = 9,5 mm  
 When using other lubrication nipples, the max. permissible screw depth of 8 mm must be observed!  
 Lubrication nipple supplied with the rail guide (unmounted).  
 Connection possible at all sides.  
 If pin holes are needed, please refer to section "Mounting instructions".

Dimensional drawing

- a) For O-ring  
Size 15: Ø 4 x 1,0 (mm)  
Size 20-45: Ø 5 x 1,0 (mm)  
Open lubrication hole as required.

- b) Lubrication nipple size 15 and 20: Funnel-type nipple  
Type A – Thread size M3 x 5, DIN 3405  
B2 = 1,6 mm  
When using other nipples, the max. permissible screw depth of 5 mm must be observed!

- Size 25 to 45:  
M6 x 8, DIN 71412  
B2 = 9,5 mm  
When using other lubrication nipples, the max. permissible screw depth of 8 mm must be observed!  
Lubrication nipple supplied with the rail guide (unmounted).  
Connection possible at all sides.  
If pin holes are needed, please refer to section "Mounting instructions".

## 3.2 Rail data

*Rails with protective caps made of plastics*

*Rails with cover strip and cover strip retaining clamps made of aluminium - without end face threaded holes (not required)*

### 3.2.1 LLRHR rails

For mounting from above with plastic mounting caps (supplied).

**NOTE:** The rails can also be supplied in several parts.

<sup>1</sup> Dimension H<sub>4</sub> with cover strip

<sup>2</sup> Dimension H<sub>7</sub> without cover strip

The “E” dimension designates the distance from the rail end to the centre of the first attachment hole.

If no customer-specific “E” dimension is provided with the order, the rails are produced according to the following formula: The distance of the first and last attachment holes is mediated.

If several possibilities arise, the shorter “E” dimension will be produced!

$$E = \frac{L - (z - 1) \times F}{2}$$

- E = Rail end dimension
- F = Distance of attachment holes
- L = Rail length
- z = Number of attachment holes

### 3.2.2 LLRHR D2 rails

For mounting from above with cover strip and strip retaining clamps.

- Robust cover strip retaining clamps made of aluminium
- Rail without end face threaded holes (not required for cover strip retaining clamps)

**NOTE:** The rails can also be supplied in several parts.

# 3.3 Accessories

Accessories		
Item name	Illustration <sup>1)</sup>	Purpose
Scraper plate		Scraper plates are spring-steel, non-contact components. They protect the front seal from coarse contaminants or hot metal chips.
Two-piece front seal		Additional front seals are contact seals that can be attached to the carriage end faces. They are singlelip seals consisting of special heavy-duty material and offer additional protection against liquids and smaller contaminants.
Sealing kit		The seal kit consists of a metal scraper and an additional front seal. It is intended for applications involving exposure to coarse and fine dirt as well as liquids.
Bellows		Bellows protect the entire system against solid and liquid contaminants from above. They are suitable for highly contaminated environments like machining centres in the woodworking and metals industries.
Lubrication adapter		
Expanding mandrel		
Loose cover strip		
Cover strip retaining clamps made of aluminium		

<sup>1)</sup> Appearance can vary slightly depending on the size

### 3.3.1 Scraper plate

**Material:**

stainless spring steel to DIN EN 10088

- Condition: bright
- Precision design with 0,2 to 0,3 mm maximum gap measurement

**Mounting:**

Fastening screws are supplied. During mounting please ensure an even gap between the rail and scraper plate. Scraper plate for rails with and without cover strip

**NOTE:** Use in combination with two-piece front seal kit LLRHZxxS3.

\* Scraper plates in combination with cover strip

### 3.3.2 Two-piece front seal

Additional front seals are contact seals that can be attached to the carriage end faces. They are singlelip seals consisting of special heavy-duty material and offer additional protection against liquids and smaller contaminants.

#### Dimensional drawing

#### Technical data

Size	Part numbers	Dimensions (mm)										Weight (g)
		A	A <sub>1</sub>	H <sub>2</sub>	W <sub>3</sub>	E <sub>9</sub>	S <sub>2</sub>	S <sub>3</sub>	D <sub>1</sub>	D <sub>2</sub>

## 3.3.6 Cover strip

### Advantages of the cover strip

The cover strip can be simply clipped on and pulled off.

- This considerably simplifies and quickens mounting:
  - It is not necessary to close every single drill hole
  - It is not necessary to wait for the adhesive to set on adhesive strips.
- Multiple mounting and removal is possible (up to 4 times)

### Cover strip with fixed seat (standard)

- The cover strip is clipped on before the carriages are mounted and stays firmly in place.

With an optionally available expanding mandrel for 0,15 mm cover strips or a special expanding tool for 0,3 mm cover strips a slide can also be retroactively created in order to remove a cover strip.

In particular, however, the slide length X can be optimally adapted to the specific application.

Please observe the precise mounting instructions!

### Cover strip for initial mounting/ stock/ replacement

For each guide rail length a matching cover strip with fixed seat can be supplied.

Ordering a standard cover strip with fixed seat

#### Example:

Rail Size 35,

Rail length L = 2 696 mm

LLRHZ 15 – 2 969 CS

(For order designation see product table)

Size	Standard cover strips Order designation, length (mm)
------	---

15	LLRHZ 15 - xxx CS
20	LLRHZ 20 - xxx CS
25	LLRHZ 25 - xxx CS
30	LLRHZ 30 - xxx CS
35	LLRHZ 35 - xxx CS
45	LLRHZ 45 - xxx CS

### 3.3.7 Expanding mandrel to create a slide on the cover strip

Size	Expanding mandrel Order designation
15	LLRHZ 15 W
20	LLRHZ 20 W
25	LLRHZ 25 W
30	LLRHZ 30 W
35	LLRHZ 35 W
45	LLRHZ 45 W

### 3.3.8 Cover strip retaining clamps

For guide rails without end-face threaded holes.

Ewellix recommends the use of cover strip retaining clamps.

These can:

- prevent unintentional removal of the strip and incursion of dirt
- fix the cover strip in place

**Materials:**

Retaining clamps made of aluminium, black anodised. Clamping screw and nut made of corrosion-resistant steel.

Order designations for cover strip retaining clamps

**Dimensional drawing**

Plastic caps are supplied as standard if a cover strip has not been ordered.

**Technical data**

Size	Retaining clamps (2 pieces per unit) Order designation	Dimensions (mm)

**Mounting  
instruction and  
maintenance**

# 4.1 Design rules

## 4.1.1 General instructions

The following mounting instructions apply to all profile rail guides.

Please note, however, that differing specifications exist concerning the parallelism of the rails as well as the screwing and pinning of the carriages. These are therefore assigned to the individual versions.

Ball profile rail guides are high-quality products. Greatest possible care should be taken during transport and subsequent assembly. All steel parts have been oil-protected. The protection materials do not need to be removed if the recommended lubricants are used.

Detailed mounting instructions are available through your normal Ewellix contact.

## 4.1.2 Assembly examples

### Rails

Each rail has ground reference edges on both sides.

Options for lateral fixing:

1. Stop edges
2. Clamp strips
3. Wedge strips

**NOTE:** The rail must have a chamfer to prevent the seal from being damaged. This is not the case for joint rail tracks

Rails without lateral fixing must be aligned straight and parallel during assembly, preferably using an auxiliary strip. (Guide values for the permissible lateral force without additional lateral fixing can be obtained from the information for the individual versions).

### Carriage

Each carriage has a ground reference edge on one side (<dimension H3 in the dimensional drawings). Additional fixing options:

1. Reference edges
2. Retaining strips
3. Clamp strips
4. Pinning

**NOTE:** After being successfully mounted the carriage should move easily when pushed.

### 4.1.3 Stop edges, corner radii, screw sizes and tightening torques

#### Carriages made of steel, type A, LA

- Standard width

#### Rails

- Can be screwed from above

#### Carriages made of steel, type U, LU, R, LR

#### Rails

- Can be screwed from above

The combinations shown are examples. In principle all carriages can be combined with all rails.

#### Technical data

	8.8	2,7	5,5	9,5	23	46	80	125
12.9	4,6	9,5	16	39	77	135	215	340

## 4.1.4 Pinning

### Carriage standard width A, LA, slim line U, LU, slim line high R, LR

If the guide values for the permissible lateral force are exceeded (see table) the carriage must be additionally fixed by means of pinning or stop edges.

The recommended dimensions for the pin holes can be obtained from the drawings and table.

#### Usable pins:

- tapered pin (hardened) or
- straight pin DIN ISO 8734

#### Instructions

For production-related reasons there may be pilot drill holes in the middle of the carriage at the recommended positions for pin holes ( $\varnothing < S_{10}$ ). They are suitable for drilling.

If necessary, the pinning must be carried out in a different position (e.g. middle lube port), but must not exceed the dimension  $L_3$  in longitudinal direction ( $L_3$  can be obtained from the dimension tables for the individual versions).

Keep to dimensions  $W_2$  and  $W_4$ !

Do not complete the pin holes until after mounting (see also general mounting instructions - available through your normal contact).

Standard width A, LA

Slim line U, LU, Slim line high R, LR

#### Technical data

Size	Dimensions Tapered pin (hardened) or straight pin (DIN 6325) $S_{10}$ mm	Dimensions (mm)			
		$L_{10}$	$W_2$	$W_4$	$N_9$ (max)
15	4	18	26	38	6,0
20	5	24	32	53	7,5
25	6	32	35	55	9,0
30	8	36	40	70	12,0
35	8	40	50	80	13,0
45	10	50	60	98	18,0

### Carriage flange short, SA, slim line, SU

If the guide values for the permissible lateral force are exceeded (see table) the carriage must be additionally fixed by means of pinning or stop edges.

The recommended dimensions for the pin holes can be obtained from the drawings and table.

#### Usable pins:

- tapered pin (hardened) or
- straight pin DIN ISO 8734

#### Instructions

For production-related reasons there may be pilot drill holes in the middle of the carriage at the recommended positions for pin holes ( $\varnothing < S_{10}$ ). They are suitable for drilling.

Flange short, SA

Slim line, SU

### Technical data

Size	Dimensions	Dimensions (mm)				
	$S_{10}$ mm	$L_{10}$	$W_4$	$W_2$	$E_{10}$	$N_9$ (max)
15	4	18	38	26	9	3,0

25	6	32	55	35	11	7,0
30	8	36	70	40	14	10,0
35	8	40	80	50	15	12,0

Tapered pin (hardened), straight pin (DIN 6325)

## 4.1.5 Loading of the screw connections between rail and substructure

The screw connections specified in the DIN 645-1 standard can become excessively loaded owing to the high performance capacity of the profile rail guides.

The screw connection between the guide rail and the substructure is critical. If the lift-off loads (F) or moments (Mt) are higher than the respective load values in the table, the screw connection must be recalculated separately.

The figures apply to the following conditions:

- Grade 12.9 fixings screws
- Screws tightened using a torque wrench
- Slightly oiled screws (for grade 8.8 screws approximately a reduction factor of 0,6 can be applied)

*Lift-off loads and moment  
Rail screwed from above*

### Technical data

Carriage	LLRH--SA, LLRH--SU		LLRH--A, LLRH--U, LLRH--R		LLRH--LA, LLRH--LU, LLRH--LR	
	F <sub>max</sub> N	M <sub>t,max.</sub> Nm	F <sub>max</sub> N	M <sub>t,max.</sub> Nm	F <sub>max</sub> N	M <sub>t,max.</sub> Nm

20	10 000	90	11 700	106	13 400	121
25	14 600	154	17 100	180	19 500	205
30	-	360	32 400	420	37 100	480
35	27 500	440	32 100	510	36 700	580
45	-	-	78 100	1 680	89 300	1 920

## 4.1.6 Height deviation

The values for height deviation apply to all carriages.

Approximately 20 % higher values are permissible for the SA (standard width short) and SU (slim line short) carriages.

Given adherence to the permissible height deviation  $S_1$  and  $S_2$ , the influence on the service life is generally negligible.

### Permissible height deviation in lateral direction

In the permissible height deviation  $S_1$ , the tolerance for dimension H according to the table is already taken into account in "Technical Data".

$$S_1 = a \times Y$$

$S_1$  = Permissible height deviation (mm)

a = Distance between the rails (mm)

Y = Calculation factor

### Permissible height deviation in longitudinal direction

#### For carriages

In the permissible height deviation  $S_2$  the tolerance "maximum difference of dimension H on a rail" according to the table is already taken into account in "Technical Data".

Approximately 40 % higher values are permissible for SA and SU carriages.

On A-type carriages (standard width long), LU and LR approx. 30 % lower values are permissible.

### Permissible height deviation $S_2$ on carriages

$$S_2 = b \times 4,3 \times 10^{-5}$$

$S_2$  = Permissible height deviation (mm)

b = Distance between the carriages (mm)

### Calculation factor Y for carriages

Calculation factor	Preload class			
	T0 up to approx. 10 $\mu$ m clearance	T1 Preload 0,02 C	T2 Preload 0,08 C	T3 Preload 0,13 C
Y	$4,3 \times 10^{-4}$	$2,8 \times 10^{-4}$	$1,7 \times 10^{-4}$	$1,2 \times 10^{-4}$

## 4.1.7 Parallelism of mounted rails measured on the rails and the carriages

The values for the deviation in parallelism  $P_1$  apply to all carriages.

Approximately 20 % higher values are permissible for the SA and SU carriages.

Deviation in parallelism  $P_1$  for carriages

Through the deviation in parallelism  $P_1$  the preload is increased somewhat on one side.

If the table values are adhered to, the influence on the service life is generally negligible.

The values shown in the following table apply to applications in which highest precision is required.

For all other uses and for general mechanical engineering doubled values can be applied.

### Technical data

Size	Deviation in parallelism P1 (mm) for high precision demands			
	T0 up to approx. 10 µm clearance	T1 Preload 0,02 C	T2 Preload 0,08 C	T3 Preload 0,13 C
15	0,015	0,009	0,005	0,004
20	0,018	0,011	0,006	0,004
25	0,019	0,012	0,007	0,005
30	0,021	0,014	0,009	0,006
35	0,023	0,015	0,01	0,007
45	0,028	0,019	0,012	0,009

## 4.1.8 Mounting of lubrication adapter

A lubrication adapter is necessary on high carriages if lubrication is to take place from the table part.

**⚠ In the recess for the O-ring seal a further small recess (1) has been performed. Do not drill this open. Risk of dirt incursion!**

- Heat up metal tip (2) with a diameter of 0,8 mm.
- Carefully open the recess (1) with the metal tip and push through.  
Observe maximum permissible depth  $T_{max}$  stated in the table!
- Insert O-ring seal (3) in the recess.
- Insert lubrication adapter at an angle in the recess and press the flattened side (4) onto the steel part (5). Use grease for fixing.
- Insert O-ring seal (6) in the lubrication adapter.

### Size

Top lubrication opening: maximum permissible depth for penetration  $T_{max}$  (mm)

### Dimensional drawing

DIN 3405, funnel-type nipple for carriage size 15 and 20

DIN 71412, cone-type nipple for carriage size 25, 30, 35 and 45

### Technical data

Size	Top lubrication opening: maximum permissible depth for penetration $T_{max}$ (mm)
15	3,6
20	3,9
25	3,3
30	6,6
35	7,5
45	8,8

## 4.1.9 Mounting bellow

The bellows are pre-mounted.  
The fixing screws are supplied.

On type 2 in each case one thread M4-10 deep, 2 x 45° countersunk, must be inserted in the end face of the rail.

Size 25 - 45:

The lubrication nipple on the carriage can be used.

Size 15 and 20:

A drive-type lubrication nipple is supplied.

### Calculation of the bellows

$$L_{min} = L_{max} - \text{Stroke}$$

$$L_{max} = (\text{Stroke} + 30) \cdot U$$

$$\text{Number of folds} = \frac{L_{max}}{W} + 2$$

$L_A$  = Carriage length  $L_1$  plus 2x12 mm for the fastening plates.

$L_{max}$  = Bellows stretched

$L_{min}$  = Bellows pushed together

Stroke = Stroke (mm)

U = Calculation factor

W = Maximum extension of folds

### Calculation of the rail length

$$L = L_{min} + L_{max} + L_A$$

L = Rail length (mm)

### Technical data

Size	Dimensions (mm)											Factor	
	A <sub>4</sub>	B <sub>3</sub>	H	H <sub>3</sub>	H <sub>4</sub>	N <sub>7</sub>	N <sub>8</sub>	S <sub>7</sub>	S <sub>8</sub>	S <sub>9</sub>	W	U

# 4.2 Maintenance and repairs

## As a function of the stroke length

### Stroke > 2 × length of the carriage

1 lube port needs to be provided per carriage (↳ fig. 1).

- Oil lubrication in accordance with ISO VG 220.

For lubrication quantities please refer to the next page.

### Stroke < 2 × length of the carriage

• 2 lube ports need to be provided per carriage (↳ fig. 2).

- Apply the prescribed lubricant quantity per lube port.
- Oil lubrication in accordance with ISO VG 220.

For lubrication quantities please refer to the next page.

## Installation in inclined or side position (wall mounting)

### Stroke > 2 × length of the carriage

• 1 lube port needs to be provided per carriage (↳ fig. 3).

- Apply the lubricant quantity stated in the table with an impulse.
- If the lubricant quantity cannot be applied with an impulse, please consult Ewellix.

## Maintenance

Dirt can drop and settle on exposed rails in particular. To maintain the function of seals and cover strips, such dirt must be regularly removed.

For this purpose a “cleaning stroke” should be carried out over the entire length of travel at least twice a day, and at the latest after eight hours.

Carry out a cleaning stroke each time before switching off the machine.

## Lubrication

Grease lubrication

Initial lubrication of the carriage (basic lubrication)

No initial lubrication is required if the carriage has been greased at the factory.

The initial lubrication takes place with three times the part quantity stated in **Table 1**:

1. Grease the carriage with the first part quantity stated in **table 1**.
2. Move the carriage backwards and forwards with three double strokes along at least three times the carriage length.
3. Repeat step 1 and 2 twice.
4. Check whether a lubricating film is visible on the rail.

Ball rail guides are supplied in protected form. With basic greasing at the factory, both grease and oil lubrication is possible.

For lubrication we recommend lubricating grease to DIN 51825: – KP2K-20, consistency class NLGI 2 to DIN 51818. This can be obtained from Ewellix, see recommendation for lubricating greases.

Never start to use carriages without basic lubrication.

Observe the manufacturer’s instructions, in particular instructions concerning incompatibilities.

**⚠ Greases with a proportion of solid lubricant (such as graphite) should not be used!**

## Re-lubricating the carriage

When the re-lubrication interval according to **Table 2** has been reached, the carriage must be lubricated with the lubricant quantity as stated in **Table 1**. Where such environmental influences as dirt, the use of coolants, vibration, shock loads etc. are encountered, we recommend that the re-lubrication intervals be shortened accordingly.

Longer re-lubrication intervals apply in the case of smaller loads.

### Short stroke

#### Stroke < 2 × carriage length

- 2 lube ports need to be provided per carriage and lubricated in each case!

#### Stroke < 0,5 × carriage length

- 2 lube ports need to be provided per carriage and lubricated in each case!
- For each lubrication cycle move the carriage 2 × the carriage length. If this is not possible, please consult Ewellix.

Lubricant quantities as stated in **Table 1** (re-lubrication). Apply the stated quantity for each lube port.

\* NLGI 00 greases reduce the relubrication intervals to 75 % of the values stated in **Table 2**.

Table 1

Size	Grease lubrication Initial lubrication by customer Part quantity (cm <sup>3</sup> )	Re-lubrication Part quantity (cm <sup>3</sup> )
15	0,4 (x 3)	0,4 (x 2)
20	0,7 (x 3)	0,7 (x 2)
25	1,4 (x 3)	1,4 (x 2)
30	2,2 (x 3)	2,2 (x 2)
35	2,2 (x 3)	2,2 (x 2)
45	4,7 (x 3)	4,7 (x 2)

Table 2

Size	Grease lubrication Relubrication intervals under normal operating conditions, v ≤ 1 m/s	
	Travel (km) under load ≤ 0,15 C	≤ 0,3 C
15	5 000	1 200
20	5 000	1 200
25	10 000	2 400
30	10 000	2 400
35	10 000	2 400

## Oil lubrication

Oil quantities for initial lubrication and re-lubrication

**⚠ Apply the entire quantity of oil with a single lubrication impulse!**

Carriages initially greased at the factory can also be re-lubricated with oil.

In the case of carriages which have not been initially greased at the factory, carry out the initial lubrication in accordance with **Table 3**.

If environmental influences such as dirt, use of coolants, vibration, shock loads etc. are encountered, we recommend that the re-lubrication intervals be shortened accordingly.

Refer to **Table 4**.

### Central oil lubrication

#### Oil quantities and lubrication impulses for central oil lubrication

**NOTE:** Recommended waiting time between the impulses: 10 seconds.

#### For example size 45:

4 impulses with in each case 0,6 cm<sup>3</sup> in 30 seconds.

Refer to **Table 5**.

Table 3

Size	Oil lubrication Initial lubrication by customer Part quantity (cm <sup>3</sup> )	Re-lubrication Part quantity (cm <sup>3</sup> )
15	0,4 (x 2)	0,4
20	0,7 (x 2)	0,7
25	1,0 (x 2)	1,0
30	1,1 (x 2)	1,1
35	1,2 (x 2)	1,2
45	2,2 (x 2)	2,2

Table 4

Size	Oil lubrication Re-lubrication intervals under normal operating conditions, v ≤ 1 m/s	
	Travel (km) under load ≤ 0,15 C	≤ 0,3 C
15	2 500	600
20	2 500	600
25	5 000	1 200
30	5 000	1 200
35	5 000	1 200

Table 4

Size	Central oil lubrication	
	Oil quantities Impulse (cm <sup>3</sup> )	Impulses per lubrication cycle Number of impulses
15	0,6	1
20	0,6	1
25	0,6	2
30	0,6	2
35	0,6	2
45	0,6	4
